

Candidate SMDI codebook and topic mappings

The supplied workbook defines 43 finer categories. Each BERTopic topic has one finer-category assignment. The separately supplied ten-domain mapping overlaps at topic level and is not a strict nesting of whole finer categories. All assignments await independent semantic validation. Counts below refer to unique training texts, not activity records.

Assignment and review rules

A record inherits the category and domain memberships of its frozen Pass-1 topic. Topic –1 abstains. A domain counts a record once even when multiple thematic rationales apply. Target text is primary evidence; parent context resolves reference without transferring a parent-only theme. A mixed-topic flag is a review warning, not evidence that all members express every theme. Independent reviewers should distinguish category evidence, absent evidence, ambiguous meaning and insufficient context, allowing multiple domains where justified. Disagreement must be measured before adjudication. This specification does not contain completed independent annotation results.
